EXPERIMENT 9

Exploring AI-Assisted Features and Built-in Analytics (Zia) in Zoho Creator — Student Admission Enquiry Form

Name	Roll Number
Akshaya S	241401009

Aim

To explore the built-in analytics, dashboard charts and report display options of a Student Admission Enquiry Form created in Zoho Creator, and to check the availability of AI-assisted (Zia) features in the account.

Objectives

- Observe the dashboard layout, including KPI cards, charts and the Student Admission Enquiries report.
- Record dashboard figures such as total enquiries, follow-ups required and confirmed admissions.
- Study charts showing enquiry distribution by programme and enquiry status.
- Inspect report display formats and view enquiry records in a Kanban board where supported.
- Check the account for Zia AI assistance and record any access or plan limitations.

Software / Tools Required

- Zoho Creator and a web browser with an active internet connection.
- A Student Admission Enquiry Form application with an Enquiries form and report.
- A Zoho account with permission to access the application.

Important: Dashboard values and applicant records shown in this edited report are illustrative examples, not verified results from your live Zoho Creator application. Replace them with your actual observations before submission.

Introduction / Theory

AI-assisted features and Zia: AI assistance in low-code platforms can help users create applications, explore data and identify insights with less manual effort. Zia is Zoho's AI assistant. Its availability depends on the Zoho Creator edition, account plan, permissions and interface version.

Built-in analytics and dashboards: A dashboard combines key figures, charts and reports on one page. For a Student Admission Enquiry Form, it can help admission staff monitor enquiry volume, follow-up status and programme interest.

Component	Purpose in the Student Admission Enquiry application
KPI cards	Summarise total enquiries, follow-ups required and confirmed admissions.
Charts	Compare enquiries by programme, enquiry source or status.
Reports	Display applicant enquiry records with fields such as applicant name, programme, contact details and status.
Interactive visualisations	Help users inspect chart values through interaction where supported.

Report Display Formats

Depending on report configuration and the account interface, records may be displayed as a list, calendar, timeline, spreadsheet, Kanban board or map. A list supports record review; Kanban can group enquiries by status; a calendar may help when follow-up dates are stored.

Procedure

1. Sign in to Zoho Creator and open the Student Admission Enquiry Form application.

2. Open the live application view and navigate to the dashboard or analytics page.

3. Inspect the Student Admission Enquiries report and identify fields such as Applicant Name, Programme, Enquiry Date, Contact Details, Preferred Course and Enquiry Status.

4. Record the KPI values actually displayed on the dashboard.

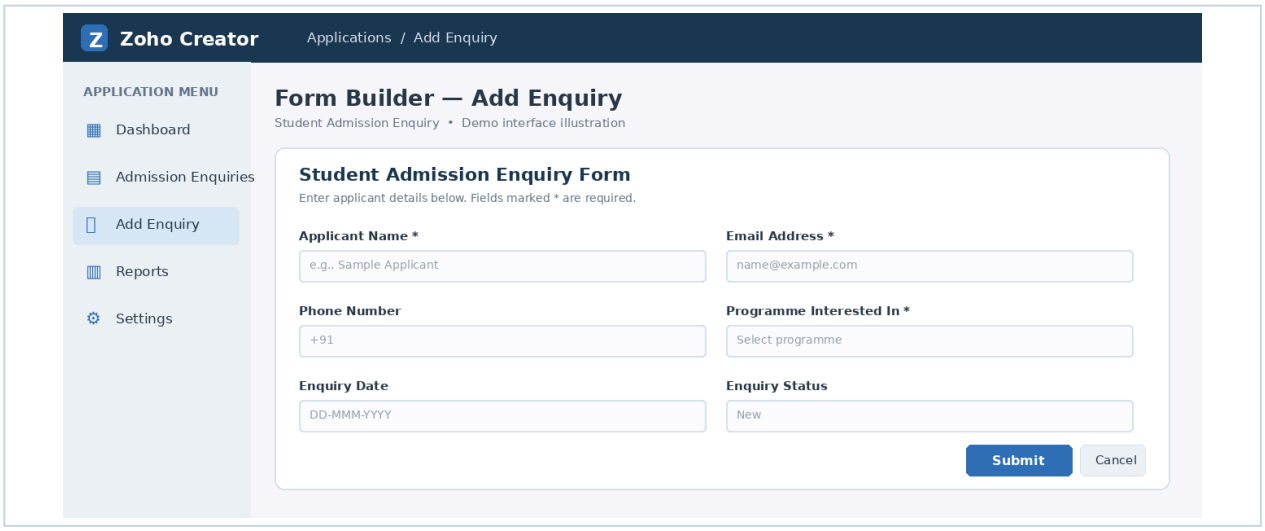

5. Examine the charts and note the categories and values represented.

6. Open the report options menu and record the display formats available in your account.

7. If Kanban is available, select it and group records by Enquiry Status or Programme. Return to the list view when finished.

8. Check whether Zia or other AI-assisted options are available and record any visible limitations.

Dashboard Analytics

The dashboard below is a schematic illustration of how analytics for the Student Admission Enquiry Form could be organised. The figures and applicant labels are sample data, not verified values from your Zoho Creator account.

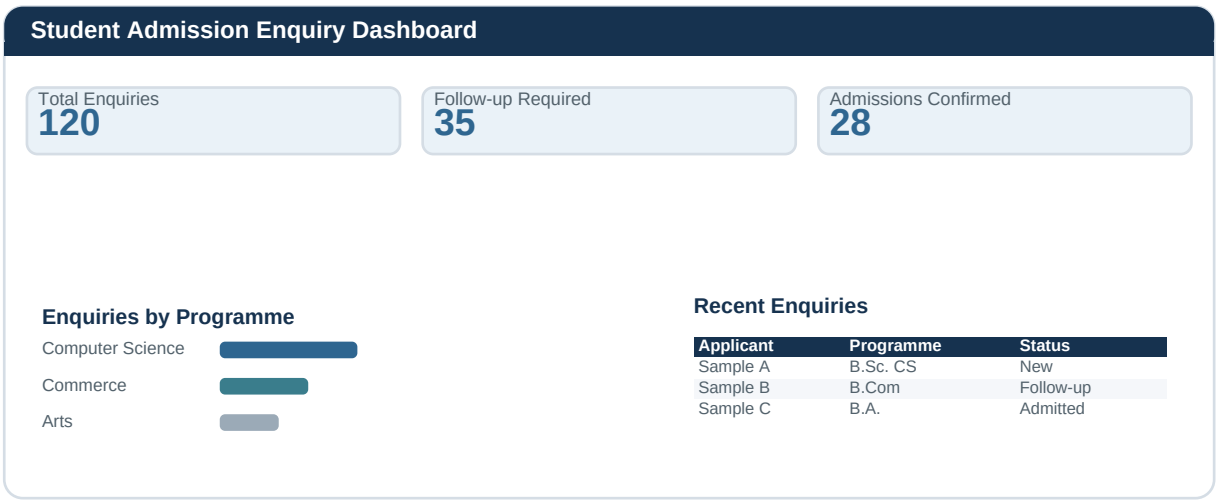

Figure 9.1: Illustrative Student Admission Enquiry Dashboard with KPI Cards, Chart and Report

Sample Dashboard Observations

Dashboard Item	Illustrative Value / Observation
Total Enquiries (KPI)	120
Follow-up Required (KPI)	35
Admissions Confirmed (KPI)	28
Programme chart	Sample counts shown for Computer Science, Commerce and Arts.
Enquiries report	Applicant records displayed with programme and status fields.

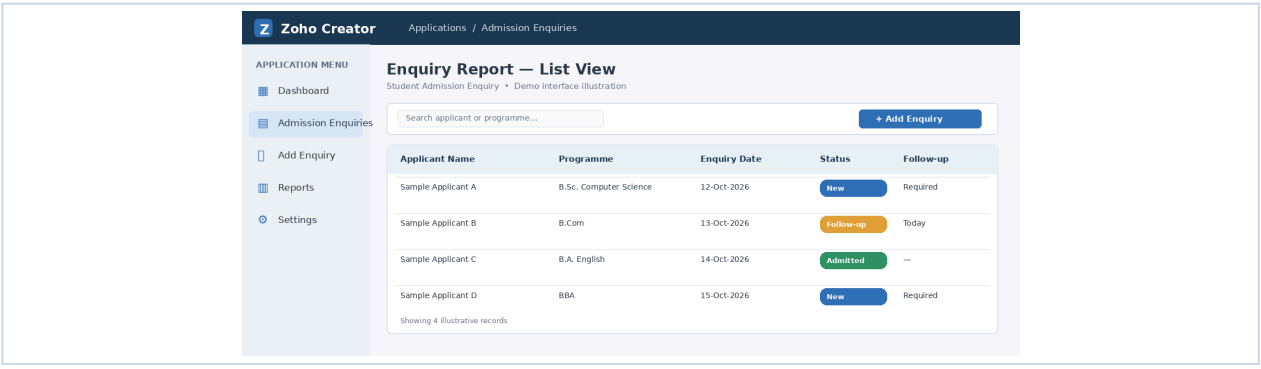

Interpretation: KPI cards give a quick overview of enquiry activity. Programme charts help staff understand applicant interest, while the report provides the individual records needed for admission follow-up.

Sample Enquiry Records

Applicant (sample)	Programme	Enquiry Date	Status
Sample Applicant A	B.Sc. Computer Science	12-Oct-2026	New
Sample Applicant B	B.Com	13-Oct-2026	Follow-up
Sample Applicant C	B.A. English	14-Oct-2026	Admitted

Use dummy applicant information in demonstrations. Avoid including real applicants' personal contact details without appropriate authorisation.

Figure 9.1: Illustrative Admission Enquiries Report

Report Display Options

Open the Student Admission Enquiries report options menu and note which formats are actually available. The table below describes common formats; availability may vary with the report fields and account interface.

Option	General Description	Use in this project
List	Displays records in rows and columns.	Review enquiry details and status.
Calendar	Places records on dates using a date field.	View enquiry or follow-up dates, if configured.
Timeline	Arranges records chronologically.	Review the sequence of enquiry activity, if supported.
Spreadsheet	Shows records in a grid layout.	Compare applicant enquiry fields.
Kanban	Displays cards grouped into lanes.	Group enquiries by New, Follow-up, Admitted or Closed.
Map	Plots records by location when location fields are configured.	Optional if location information is collected.

Kanban Board Observation (Illustrative)

Lane / Status	Sample Card Count	Sample Observation
New	1	Sample Applicant A
Follow-up	1	Sample Applicant B
Admitted	1	Sample Applicant C
Closed	0	No sample records in this lane

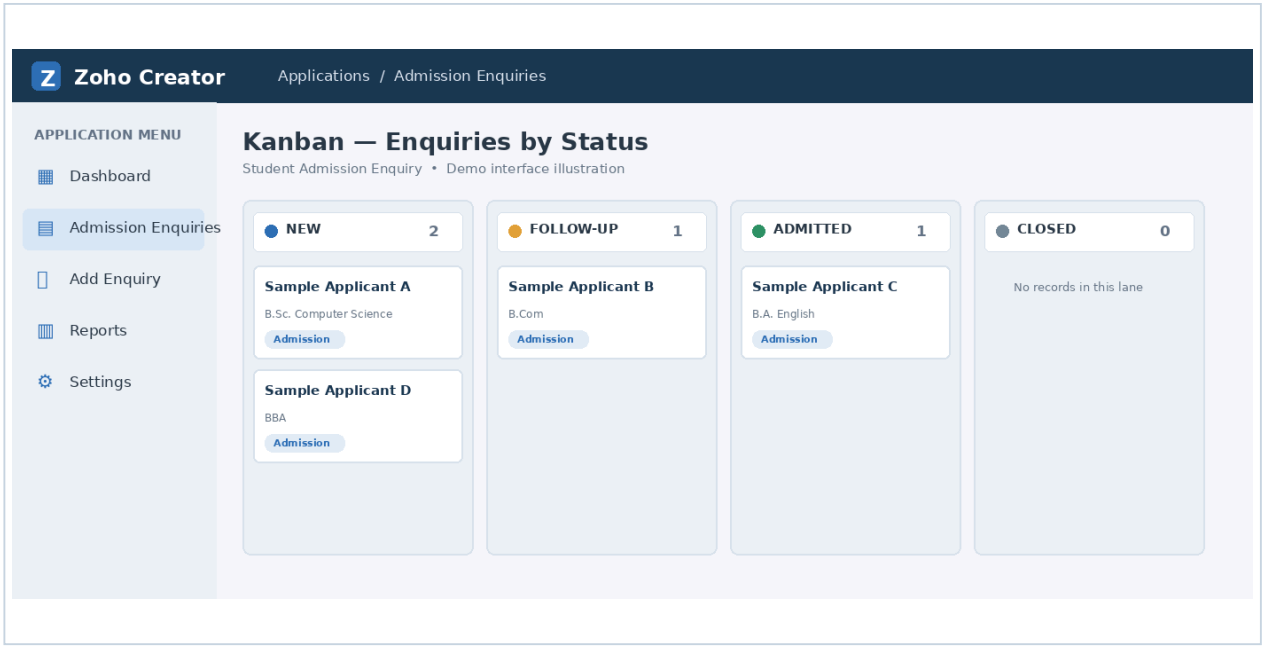

Figure 9.2: Illustrative Kanban Board Grouped by Enquiry Status

When testing the actual application, record the real number of cards in each lane. If Kanban or the grouping field is unavailable, note that limitation rather than reporting the sample counts as actual results.

System Architecture and Zia Audit

The form stores student enquiry information, the report presents records in different layouts, and the dashboard combines KPIs and charts. Zia availability should be checked directly in the current account. If an AI option is absent, record that it was not available or not demonstrated in that account.

Figure 9.2: Illustrative Kanban Board Grouped by Enquiry Status

Observation and Testing Record

Use this checklist while running the experiment in your own Zoho Creator application. Sample values elsewhere in this report are illustrative only.

Test	What to Inspect	Result to Record
Dashboard loads	Dashboard opens without error.	Pass / Fail: _____
KPI cards	Enquiry and follow-up counts are visible.	Values: _____
Programme chart	Programme categories and counts are displayed.	Categories / values: _____
Enquiries report	Configured applicant enquiry fields are visible.	Fields: _____
Display menu	List and other supported formats appear.	Available formats: _____
Kanban grouping	Cards group by enquiry status or programme, if supported.	Lane names / counts: _____
Zia / AI options	Check for AI-assisted features in the account.	Available / unavailable / not checked

Expected Learning

- Dashboard KPIs help admission staff understand enquiry volume and follow-up workload.
- Charts make it easier to compare interest in different programmes or review enquiry statuses.
- List, calendar and Kanban views support different workflows for reviewing, scheduling and following up enquiries.
- Zia functionality is account-dependent and should be reported based on what is actually visible.

Limitations

- Dashboard values and sample records in this edited report are illustrative, not evidence of a live application test.
- Exact report formats depend on the fields, configuration and Zoho Creator interface.
- AI-assisted functionality may depend on plan, permissions and availability in the current account.

Result

The Student Admission Enquiry Form experiment demonstrates how Zoho Creator can present admission enquiry data through dashboard KPI cards, charts and reports. The actual values should be verified and entered from the user's application.

- Dashboard KPI cards were identified for summarising total enquiries, follow-ups and confirmed admissions.
- A programme or enquiry-status chart was considered for comparing categories.
- The Student Admission Enquiries report display options were inspected, including Kanban or Calendar where available.
- The availability of Zia / AI-assisted features was checked in the account.

Conclusion

The experiment illustrates how built-in analytics and report views in Zoho Creator can support a Student Admission Enquiry Form. KPI cards provide a quick summary of enquiry activity, charts show applicant interest across programmes or statuses, and report layouts help staff review and organise individual enquiries. Calendar views can support date-based follow-up, while Kanban views can support status-based tracking. Zia functionality must be assessed in the specific account and plan. For an accurate final submission, replace all illustrative values and sample records with observations from the actual application.

Final Submission Checklist

- Confirm that the name and roll number are correct.
- Replace illustrative KPI values and sample records with actual application observations.
- Insert screenshots from your own Zoho Creator app if required by your instructor.
- Verify the report formats and Zia availability shown in your account.
