AUTOMATED WORKFLOW & DELUGE SCRIPTING

Student Admission Enquiry Form — Zoho Creator Lab Record

Name: Akshaya S
Roll Number: 241401009

1. Aim

To design and implement an automated workflow in Zoho Creator for the Student Admission Enquiry Form using Deluge scripting, and to test the workflow to confirm that an acknowledgement email is triggered after a student submits an enquiry.

Objectives

• Configure a form-level workflow that runs after a new admission enquiry is submitted.
• Use Deluge scripting to send an acknowledgement email to the student.
• Test the form, validate record creation, and debug any workflow or email errors.

2. Procedure

Step 1: Open Workflow settings. Open the Zoho Creator application in Edit mode, choose *Workflows* from the left navigation panel, and select *Create New Workflow*.

Step 2: Select the form and trigger. Choose *Student Admission Enquiry Form* as the target form. Set the record event to *Created* and the form event to *Successful Form Submission*.

Step 3: Name the workflow. Use a clear name such as *Send Admission Enquiry Confirmation*, then create the workflow.

2. Procedure (Continued)

Step 4: Add a Deluge action. In the workflow diagram, select *Add New Action* and choose *Deluge Script* to open the script editor.

Step 5: Configure the email script. Use the applicant's email field as the recipient and write a clear subject and message. Confirm that the field link name matches the actual form field before saving.

Example Deluge script (adjust *Email_Address* to the actual field link name in the form):

```
sendmail
[
    from : zoho.loginuserid
    to : input.Email_Address
    subject : "Admission Enquiry Received"
    message : "Thank you for your interest in our institution. We have received your admission enquiry. Our
];
```

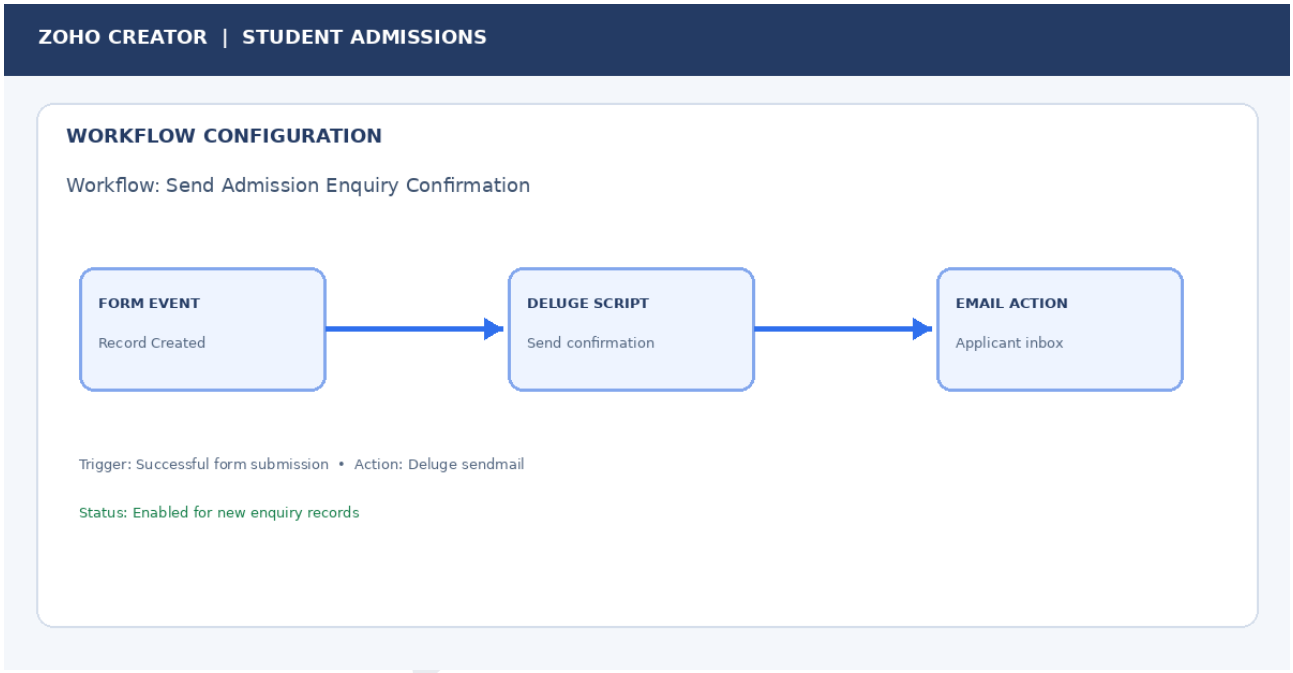

Figure 2. Illustrative workflow showing form submission, Deluge action, and email notification.

Step 6: Save and validate. Review the script for spelling, quotation marks, brackets, and correct field link names. Save the workflow and resolve any validation messages.

Step 7: Test the live form. Open the application's live view, enter sample student details and a valid test email address, then submit the enquiry.

3. Output

3.1 Deluge Script Configuration

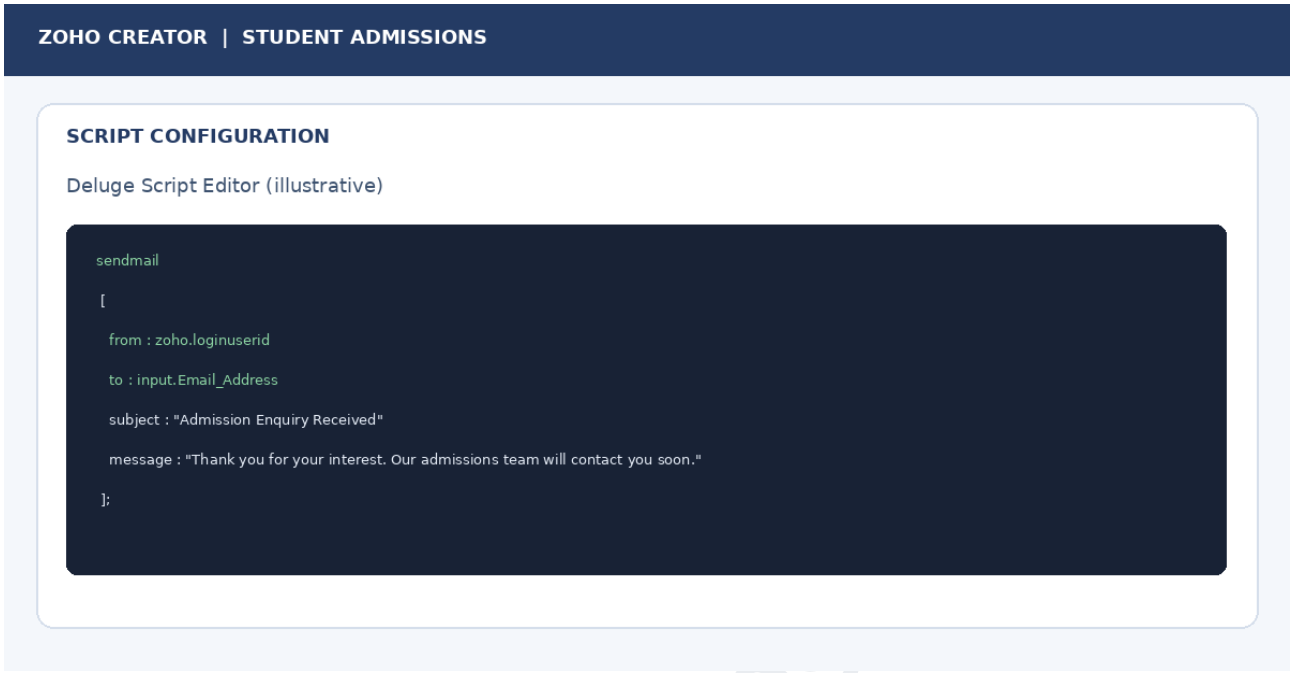

Figure 3. Illustrative Deluge editor showing the email confirmation logic.

The workflow uses the successful submission event to execute the Deluge script. The script sends an acknowledgement to the email address entered in the admission enquiry form. The field link name must be identical to the configured email field in Zoho Creator.

3.2 Testing and Debugging

1. Submit a test enquiry using valid sample data.
2. Confirm that the enquiry record appears in the application report.
3. Check the recipient inbox and spam folder for the acknowledgement email.
4. If the email is not received, verify the recipient field, sender configuration, workflow status, and script validation messages.

3.3 Expected Output

Test	Expected result
Form submission	A new admission enquiry record is created.
Workflow trigger	The workflow runs after successful submission.
Email action	An acknowledgement email is sent to the entered email address, subject to valid configuration.

3. Output (Continued)

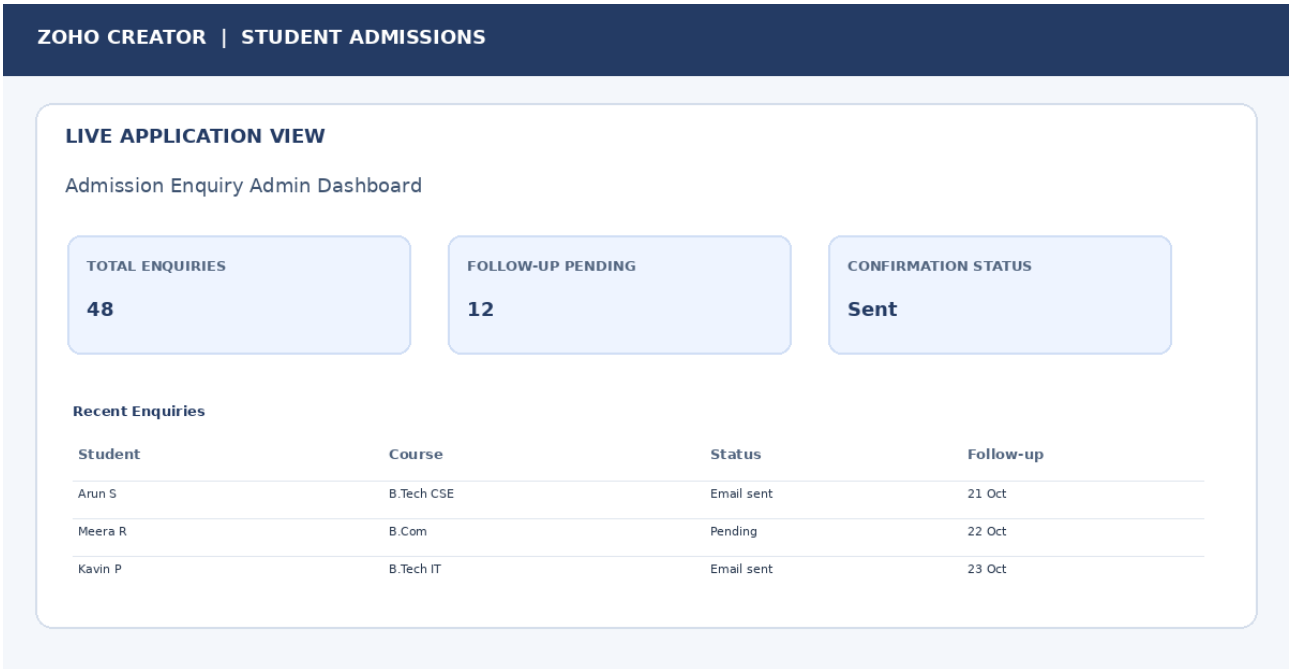

Figure 4. Illustrative admissions dashboard with enquiry counts and follow-up status.

The dashboard mock-up demonstrates how enquiry records and follow-up status could be reviewed in one place. The displayed sample values are illustrative and are not live Zoho Creator data.

4. Result

A form-level workflow for the Student Admission Enquiry Form was designed using Zoho Creator's workflow settings and Deluge scripting. The workflow is intended to run when a new enquiry is submitted and send an acknowledgement email to the student. The live result depends on configuring the correct field link name, email settings, and workflow activation in the actual Zoho Creator application.

5. Conclusion

This experiment demonstrates how low-code workflow automation can reduce manual follow-up after admission enquiries. By combining a structured enquiry form, a submission trigger, and an email action, the application can acknowledge enquiries promptly and support a more organised admissions process.

Note: The interface images in this report are illustrative mock-ups created for documentation; they are not screenshots from a live Zoho Creator application.
