# ZOHO CREATOR INTEGRATION WITH ZOHO CALENDAR

Student Admission Enquiry Form — Integration Lab Record

**Name:** Akshaya S
**Roll Number:** 241401009

## 1. Aim

To integrate the Student Admission Enquiry Form in Zoho Creator with Zoho Calendar using a connection, conditional workflow, and Deluge scripting so that an admission follow-up event can be created from a submitted enquiry.

## Objectives

• Configure a connection to Zoho Calendar.
• Link the connection to the Student Admission Enquiry Form application.
• Create a conditional workflow and use Deluge scripting to send event details to the calendar API.
• Verify the connection and test the workflow using sample enquiry data.

## 2. Procedure

**Phase A: Create the connection.** Open the Zoho Creator application in Edit mode. Under *Develop*, open *Microservices*, select *Connections (Pick & Create)*, and choose Zoho Calendar. Provide a connection name such as *admission_calendar_connection*, select the required authorization access, and authorize the connection.

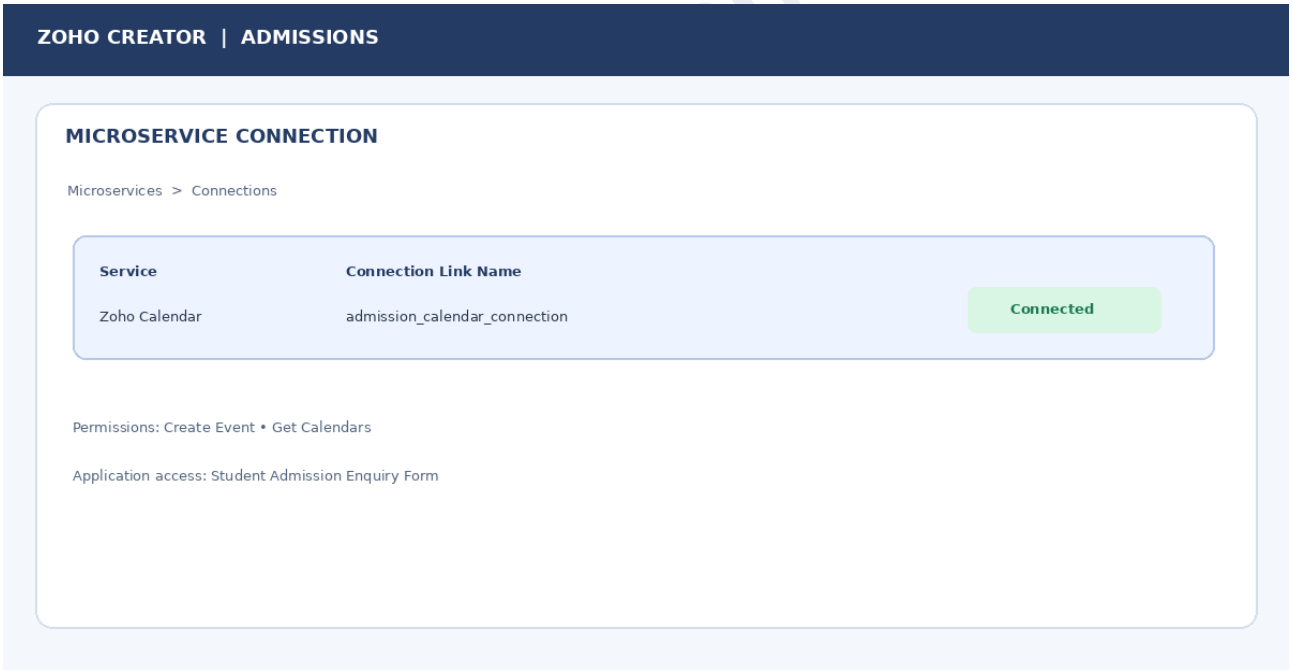

Figure 1. Illustrative Zoho Calendar connection panel for the admissions application.

**Phase B: Verify permissions.** Open the connection settings and review the required permissions, such as getting calendars and creating events. Ensure the connection is enabled for the Student Admission Enquiry Form application.

## 2. Procedure (Continued)

**Phase C: Create a conditional workflow.** Open the Student Admission Enquiry Form and choose *Workflows*. Create a workflow named *Sync_To_Admission_Calendar* with the trigger *Created* → *Successful Form Submission*. Set the action to run only when the chosen admission follow-up condition is satisfied.

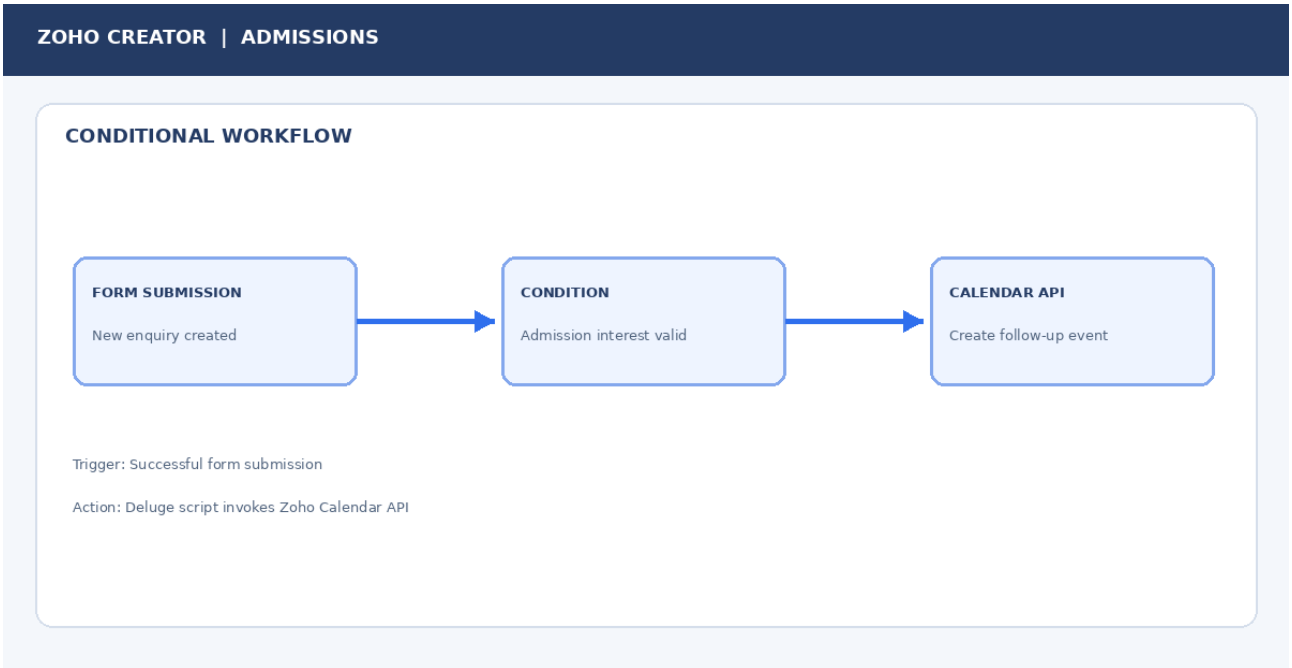

Figure 2. Illustrative workflow from enquiry submission to calendar event creation.

**Phase D: Configure Deluge scripting.** Add a Deluge Script action. Map the student name, course of interest, email, and preferred follow-up date/time to an event-details map. Use *invokeurl* with the authorized connection link name to call the appropriate Zoho Calendar API endpoint.

**Illustrative script structure** — update field link names, API URL, date/time format, and parameters to match the actual Zoho Creator form and Zoho Calendar API configuration.

```
eventDetails = Map();
eventDetails.put("title", "Admission follow-up");
eventDetails.put("description", input.Student_Name);
\
// Configure the API URL and required date/time fields
// according to your Zoho Calendar API setup.
response = invokeurl
[
    url : calendar_api_url
    type : POST
    parameters : eventDetails
    connection : "admission_calendar_connection"
];
info response;
```

**Step 5: Save and validate.** Check field link names, API endpoint, required parameters, permissions, and connection name. Save the script after resolving validation errors.

## 3. Output & System Verification

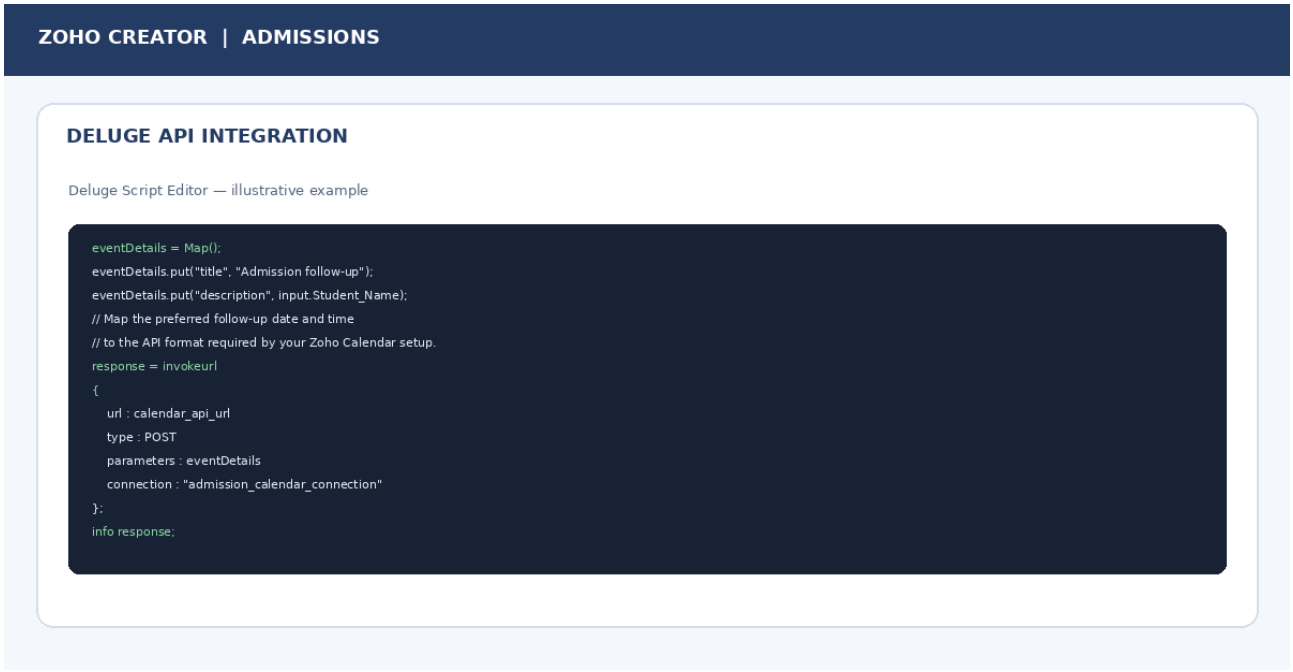

Figure 3. Illustrative Deluge editor showing the calendar integration structure.

The script structure demonstrates how the form data can be assembled and passed to a calendar API call. The actual event creation depends on using the correct endpoint, supported fields, date/time formatting, and authorized connection.

## Verification checklist

| Check | Expected observation |
|---|---|
| Connection setup | Zoho Calendar connection is authorized and enabled for the application. |
| Workflow trigger | Workflow runs after a new enquiry is submitted and conditions are met. |
| API response | The API returns a successful response when request parameters and permissions are valid. |
| Calendar event | The admission follow-up event appears in the selected calendar if creation succeeds. |

## 3. Output (Continued)

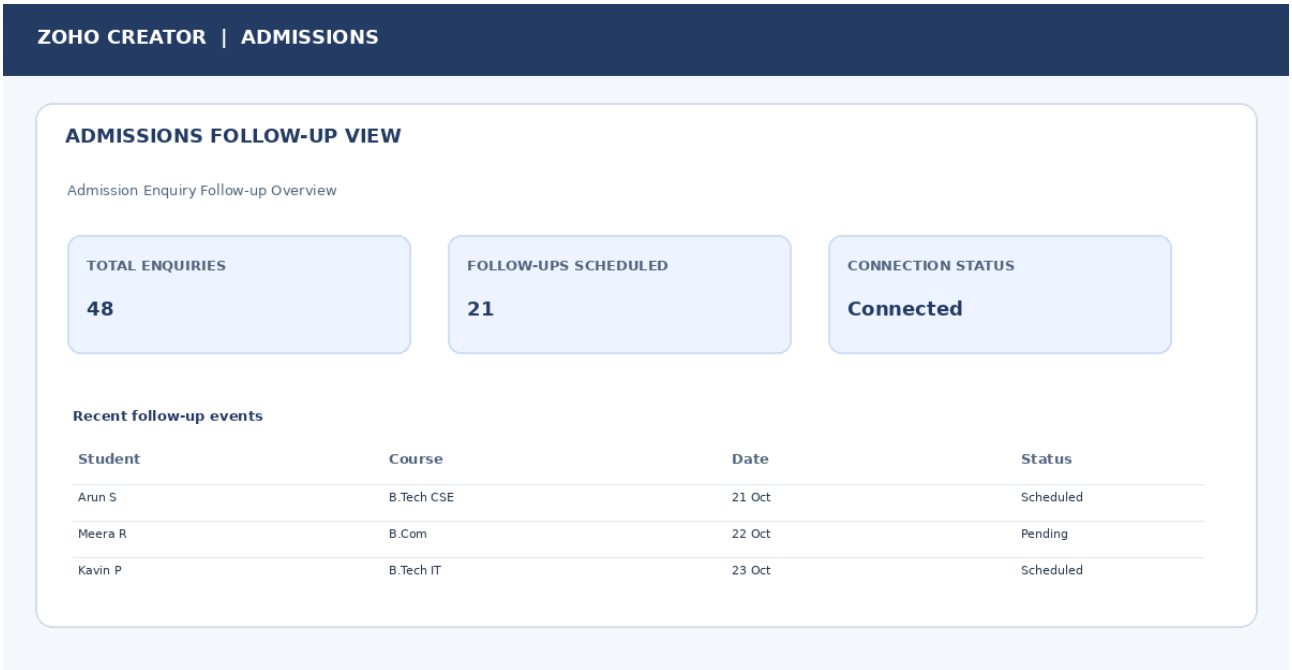

Figure 4. Illustrative admission follow-up dashboard and calendar status view.

The sample dashboard illustrates how admissions staff could review enquiry volume, scheduled follow-ups, and connection status. All displayed values are examples and are not live application data.

## 4. Conclusion

This lab exercise demonstrates the integration pattern for connecting a Zoho Creator admission enquiry application with Zoho Calendar. A microservice connection, conditional workflow, and Deluge script can be combined to support automated follow-up scheduling. Successful deployment requires correct API details, field mappings, permissions, and live testing in the actual application.

Note: The interface pictures are illustrative mock-ups created for this report, not screenshots from a live Zoho Creator application. The script is a structural example and must be configured with the actual API endpoint and field link names before use.
