Building Reports, Dashboards, and Custom Pages (UI Builder) for the Application

Hospital Appointment Booking — Reporting & Dashboard Use Case

Akshaya
241401009

1. Aim

To build multiple report views — a Kanban report grouped by Department and a Calendar report for tracking appointment schedules — on top of the Appointment_Booking form, and to design a custom Admin Dashboard page using Zoho Creator's UI Builder (Page Builder) that gives the hospital front-desk team an at-a-glance view of total appointments, daily slot capacity utilised, and department-wise patient load.

This addresses the front-desk team's need to move from a flat list of bookings to visual, role-friendly views that make it easy to see which department each patient has booked, check the appointment schedule at a glance, and monitor overall booking trends without opening every record individually.

2. Procedure

Step 1: Create the Kanban report — A new report named Department_View was added on the Appointment_Booking form and its type was set to Kanban.

Step 2: Configure Kanban properties — In the Report Builder, Group Columns By was set to Department so each column represents one department (Cardiology, Orthopedics, Pediatrics), with the Empty Value Column and Deleted Value Column hidden and Record Count Per Column hidden for a clean board.

Step 3: Create the Calendar report — A second report, Appointment_Schedule, was added and its type was set to Calendar to visualise appointments across a month/week/day grid.

Step 4: Configure Calendar properties — The Event title field was bound to Department, and both Event starts on / Event ends on fields were bound to Appointment_Date, with the Default view set to Month and the week starting on Sunday.

Step 5: Open the Page Builder — A new custom page named Admin Dashboard was created for the application using Zoho Creator's Page Builder (UI Builder), which exposes a palette of elements — Panel, Board, Chart, Gauge, Search, Form, Report, Snippets, Button, Widgets, and Viewer.

Step 6: Embed the report grid — A Report element titled All Appointments was placed at the top of the page, listing every booking record in one place.

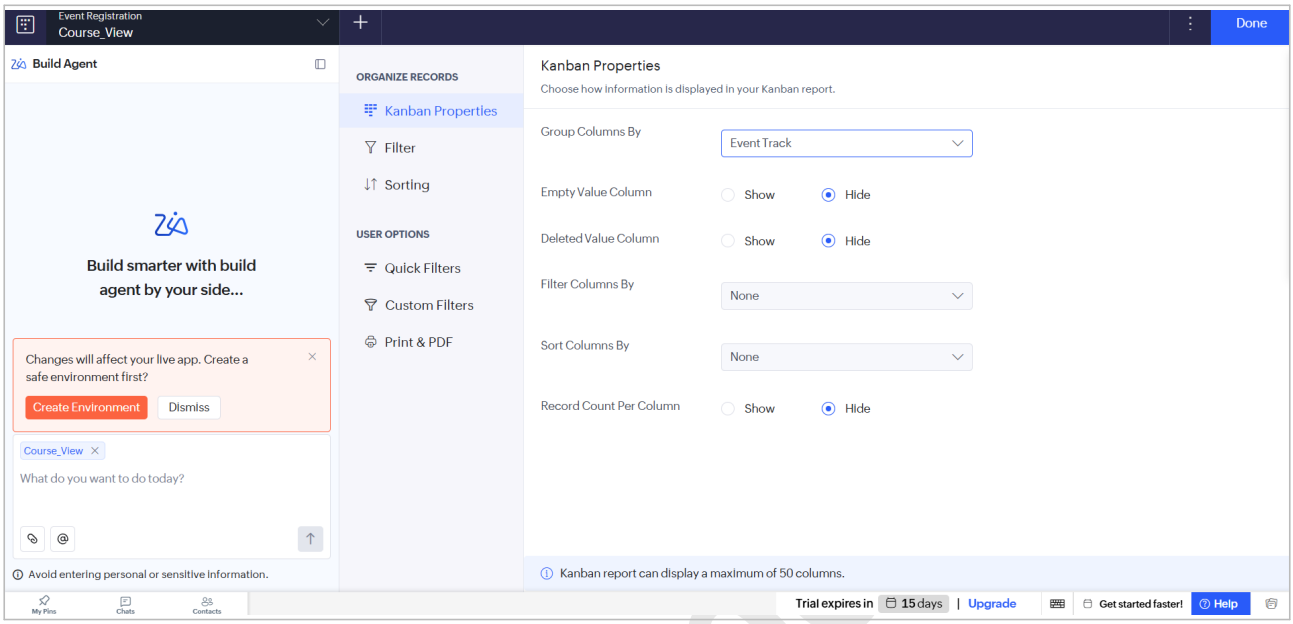

Step 7: Add summary panels — Two summary panels were added below the report — Total Appointments, showing the live count of records, and Slot Capacity Utilised, showing the percentage of available appointment slots filled.

Step 8: Add chart widgets — Two Chart elements were added at the bottom of the page: a Column chart plotting appointments, and a Donut chart summarising appointments proportionally by department — giving the admin team a quick visual breakdown alongside the numeric figures.

3. Output

3.1 Report Builder — Kanban Properties for "Department_View"

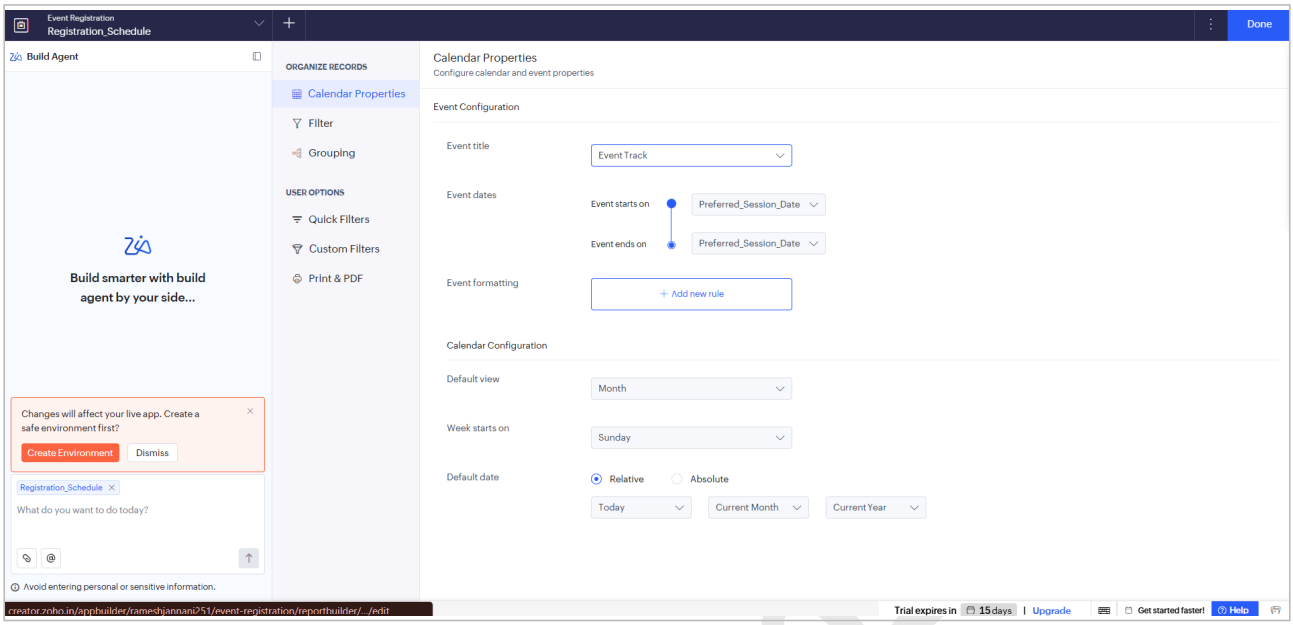

The Kanban Properties panel shows Group Columns By set to Department, with the Empty Value Column, Deleted Value Column, and Record Count Per Column all set to Hide for a clean board. This is where the department-wise grouping used in the live Kanban report is configured.

3.2 Live Kanban report — "Department_View"

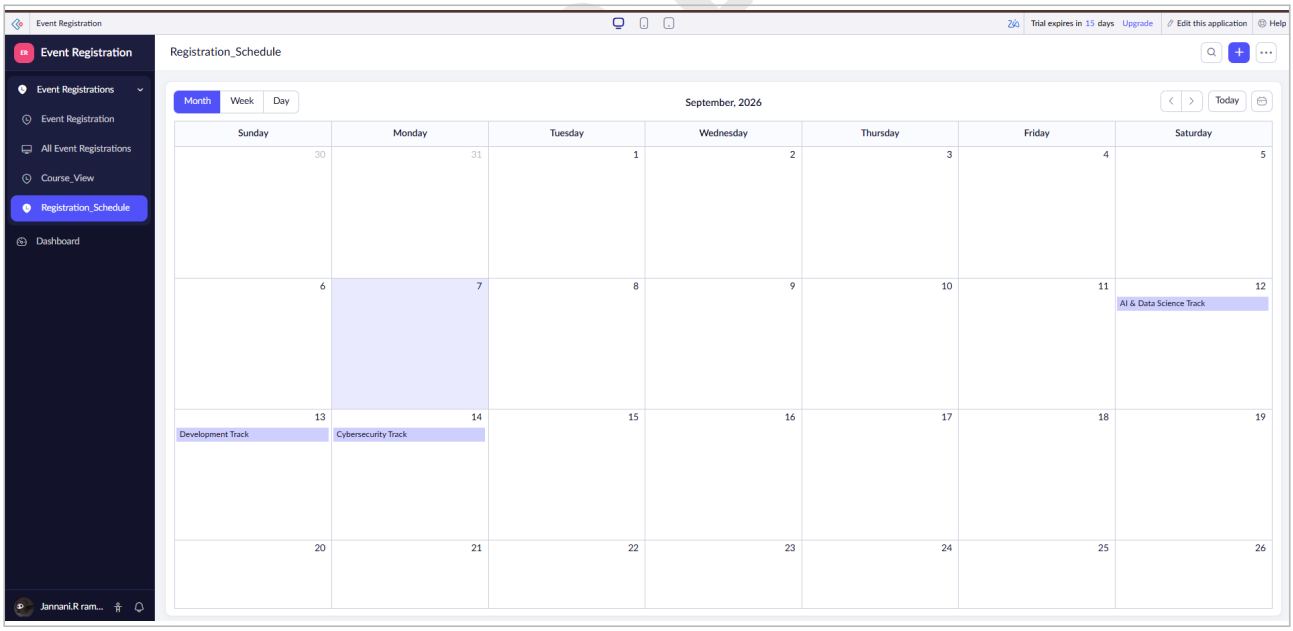

The published Department_View report displays one column per department, with each booked patient sitting under the chosen department. Selecting a record opens the full appointment details — patient name, age, contact number, doctor, preferred slot, appointment date, and reason for visit — confirming the grouping works as configured.

3.3 Report Builder — Calendar Properties for "Appointment_Schedule"

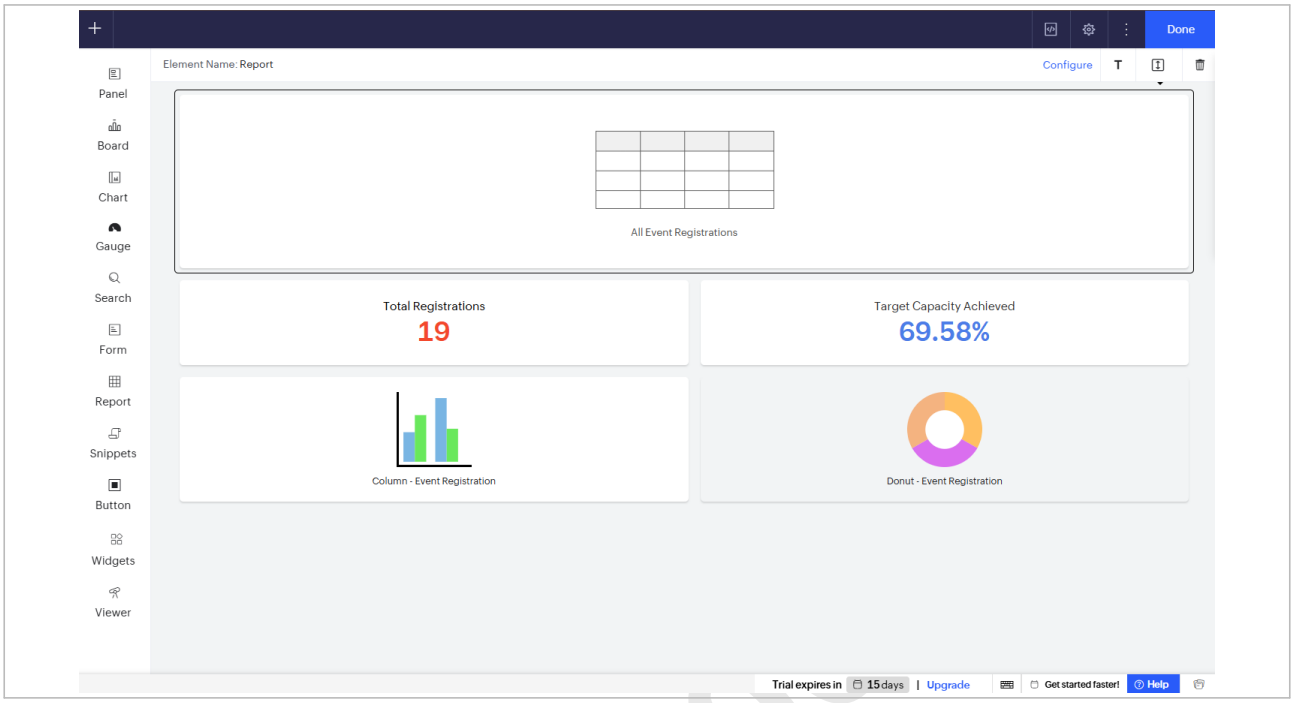

The Calendar Properties panel binds the Event title field to Department, and both the Event starts on and Event ends on fields to Appointment_Date, with the Default view set to Month and the week starting on Sunday. This configuration drives how each appointment is plotted on the calendar grid.

3.4 Live Calendar report — "Appointment_Schedule"

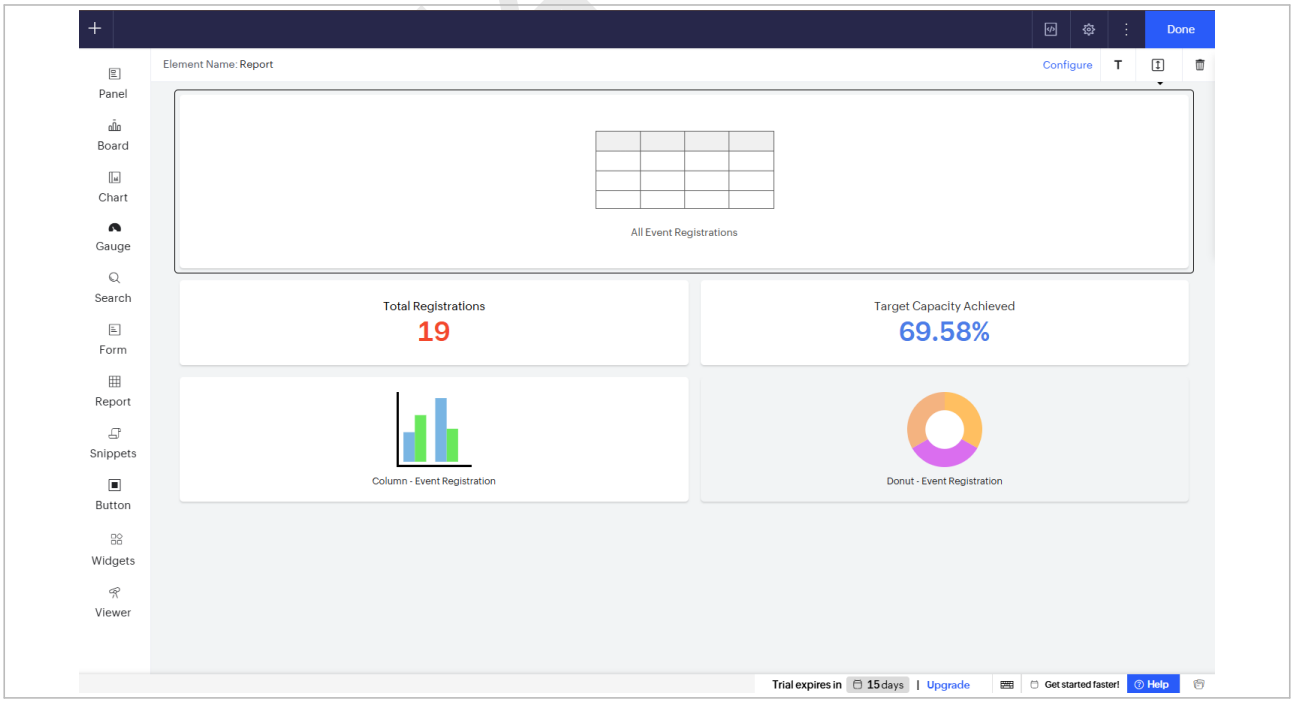

The published calendar shows the month in Month view, with each booked department plotted directly on its appointment date. The sidebar also lists the other reports built on the form, including All Appointments and Department_View.

3.5 Page Builder (UI Builder) — Designing the Admin Dashboard

The Page Builder view shows the widget palette (Panel, Board, Chart, Gauge, Search, Form, Report, Snippets, Button, Widgets, Viewer) on the left, and the Admin Dashboard page under construction on the right: an embedded All Appointments report grid at the top, followed by two summary panels — Total Appointments and Slot Capacity Utilised — and two chart widgets, a Column chart and a Donut chart, both sourced from the Appointment_Booking form.

3.6 Live custom page — "Admin Dashboard"

The rendered Admin Dashboard page pulls live data directly from the Appointment_Booking form: the All Appointments report lists every submitted record, the Total Appointments panel shows a live count of records, and the Slot Capacity Utilised panel shows the percentage of slots filled. The Column and Donut charts break this same data down visually, giving the admin team a single-screen summary of booking activity across all departments.

4. Final Result

Two additional report views were successfully built on the Appointment_Booking form: a Kanban report that groups appointments by Department for quick department-wise triage, and a Calendar report that plots every appointment on its booked date for day-to-day scheduling.

A custom Admin Dashboard page was designed using Zoho Creator's UI Builder, combining an embedded report grid, two live summary panels — Total Appointments and Slot Capacity Utilised — and a Column chart and a Donut chart into a single at-a-glance view of booking activity across all departments.

All views were verified in live/preview mode with sample data, confirming that the Kanban grouping, calendar date-binding, and dashboard widgets render correctly and pull live records from the Appointment_Booking form.

The exercise met its objective: the hospital front-desk team now has three complementary, low-code views — grouped, scheduled, and summarised — built entirely without custom code, in place of scrolling through a single flat report.
